

This document breaks the full build into eight monthly phases

So you can track exactly what's delivered, when, and what it costs — before a line of code is written.

What this build covers

This is the Core Platform: everything needed to launch with your Minecraft server, real player identity, real statistics, and a working Impact Points system. It does not include tournaments, teams, or additional games — those are a defined second phase, priced separately once this is live.

How your launch event raises money — this build includes the full payment and donation system. Players buy or earn Impact Points and allocate them to a cause, right there at the event, and the cause page shows the total live as it grows. This is how the money actually moves — it's not a separate add-on, it's built into the Core Platform from month two.

Included in this build

- ✓ Accounts & authentication
- ✓ Minecraft account linking with in-game verification
- ✓ Player profiles — avatar, bio, activity history
- ✓ Live player statistics from your server
- ✓ Global & server leaderboards
- ✓ Achievements, levels & ranks
- ✓ Activity feed — posts, screenshots, milestones
- ✓ Friends, follows & private messaging
- ✓ Notifications
- ✓ Impact Points — purchases, playtime earning, caps
- ✓ Point allocation to causes, full history
- ✓ Charity cause pages with progress tracking
- ✓ Your server page
- ✓ Community forum, themed, single sign-on
- ✓ Admin dashboard — see phase 5 for the full breakdown
- ✓ Testing, hardening & launch support

Not in this build — phase two

- Tournaments & brackets
- Teams, clans & guilds
- Multi-server directory & reviews
- Sponsor & influencer logo/recognition pages (public giving itself is included — see note above)
- Seasonal progression & resets
- Additional games beyond Minecraft
- Platform-wide search across all content

On the forum theme — the community forum runs on Invision Community, self-hosted, connected to your platform with single sign-on. It's fully custom-themed to match the rest of the platform, so it feels like one product, not a separate site bolted on.

Build phases

Six months of build, laid out month by month with what ships in each one. Payments continue two months past launch — see the schedule below.

01 Foundation & Identity

Month 1

The base everything else is built on — accounts, and a verified link between a player's web account and their Minecraft identity.

- ☐ Sign-up and login — email/password plus social login
- ☐ Password reset and account recovery
- ☐ Core data model — built game-agnostic from day one so future games plug in without a rebuild
- ☐ Minecraft username lookup and UUID linking
- ☐ In-game verification code flow (proves the player owns the account)
- ☐ Base player profile — avatar upload, bio, display name
- ☐ Account settings — privacy, notifications preferences
- ☐ Staging environment and production hosting set up
- ☐ Deployment pipeline so future updates ship safely

What players see

They sign up, drop their Minecraft username in, get a one-time code to type in-game, and their account is linked and verified in under a minute. From here on, the platform knows exactly who they are.

02 Payments & Donations — Impact Points

Month 2

This is the system your players use to pay and donate at your launch event — buy points, earn points by playing, then send them to a cause. It's built to the standard of financial software, because it's handling real money and real charity giving, not a game-points counter.

- ☐ Points ledger — every earn, allocation and reversal recorded permanently, balances never edited directly
- ☐ Purchase tier setup — pricing, point values, tier management
- ☐ Payment gateway integration and checkout flow
- ☐ Safe handling of duplicate/repeat payment confirmations, so no one is ever charged or credited twice
- ☐ Playtime-based earning with daily caps
- ☐ Abuse detection — AFK farming, alt-account patterns
- ☐ Refund & chargeback handling that correctly reverses allocated points
- ☐ Cause allocation flow — pick a cause, send points, confirm
- ☐ Per-player earn & allocation history, fully searchable

This is how your launch event works

A player at your event opens the app, buys or earns points, picks a cause, and sends their points to it — done in a few taps. This is the exact flow that raises money on the day. Every point earned or given is logged, so nothing is ever unaccounted for.

03 Stats, Leaderboards & Server Data

Month 3

Pulling live data out of your Minecraft server and turning it into stats and rankings players actually check.

- ☐ Ingestion pipeline pulling data from your server plugins
- ☐ Stat normalization — turning raw plugin data into clean, comparable stats
- ☐ Player statistics display on profiles
- ☐ Global leaderboards, pre-calculated for instant loading at scale
- ☐ Server-specific leaderboards
- ☐ Your server page — description, rules, live stats, how to join
- ☐ Achievement definitions tied to real stat milestones
- ☐ Level & rank engine with automatic progression
- ☐ Achievement unlock notifications

What players see

Their real stats from your server show up on their profile automatically — no manual entry. They can check where they rank globally or just against your community, and watch achievements unlock and their rank climb as they play.

04 Community & Social

Month 4

The layer that makes it feel like a community rather than a dashboard — plus the forum, connected and matched to the platform.

- ☐ Activity feed — post updates, screenshots, achievement & milestone events
- ☐ Feed interactions — likes, comments, reactions
- ☐ Friend requests and follows
- ☐ Private messaging, one-to-one
- ☐ Notification system — in-app and email
- ☐ Invision Community installed on self-hosted infrastructure
- ☐ Full custom theme built for Invision, matched to the platform's look
- ☐ Single sign-on — one login for the platform and the forum
- ☐ Shared bans — a ban on one side applies on both
- ☐ Forum posts and replies bridged into the main activity feed

What players see

They post a screenshot or a win to their feed, follow their friends, and message them directly. When they head into the forum it's the same account, same avatar, same login — it never feels like they left the platform.

The public page where your community and sponsors watch the fundraising total climb, plus the tools your team needs to run the platform day to day.

- ☐ Charity cause pages — description, story, fundraising progress bar
- ☐ Allocation totals shown per cause, updating in real time

Admin dashboard — exact capabilities

- ☐ Search, view and edit any player's account and profile
- ☐ Suspend or ban a player, with reason logged
- ☐ Reverse a ban
- ☐ View, edit or remove any activity feed post
- ☐ View, edit or remove any forum post or thread (via the forum's own moderation tools, surfaced through single sign-on)
- ☐ Search and view any player's full Impact Points ledger — every earn, allocation and reversal
- ☐ Issue a manual point correction or reversal for a support case, logged with an admin note
- ☐ Create, edit or unpublish a cause page
- ☐ Manually adjust a cause's displayed fundraising total, for corrections
- ☐ View and edit purchase/payment records tied to a player
- ☐ Assign or remove admin/moderator access for team members
- ☐ Edit notification and email templates (wording, not new triggers)

Not included in the admin panel — custom reports or analytics dashboards, role-based permission tiers beyond a simple admin/moderator split, bulk actions (e.g. mass-banning, bulk point adjustments), audit-log export, or an activity/change history view beyond what's logged per action above. These are common phase-two requests — flagging now so they don't arrive as "small additions" later.

What players see

Every cause has a real page showing how much has been raised and how close it is to its goal, so allocating points feels like it's actually going somewhere.

What your team gets

Everything above — manage players, moderate posts, correct the points ledger when a support case needs it — without touching a database.
